What is Dockerfile?

- A Dockerfile is **a text file that contains a set of instructions to build a Docker image**.
- Each instruction in a Dockerfile defines a **step** in the image-building process, such as specifying the **base image**, **installing software**, **copying files**, or **setting environment variables**.
- The Dockerfile serves as a **blueprint** for creating a Docker image, which can then be used to run containers in a consistent and reproducible way.
